Plant Environment Stress Gene Database

[Home](#) [Search](#) [Tools](#) [Statistics](#) [Acknowledgement](#) [Contact Us](#) [User Manual](#) [Submit Data](#)

## Plant and Environment Stress

Land plants are frequently exposed to a variety of undesirable, or even adverse, environmental conditions due to their sessile nature. Abiotic (salinity, drought, heat, cold, heavy metals, ozone, UV radiation, and nutritional deficits) and biotic (microbes, insects, and herbivores) stressors are key restrictions that affect plant development, growth, and reproduction and pose a major threat to the lives of plants. The catastrophic forecast of global warming, which is expected to have a negative impact on crop yield and thus on food production, is expected to increase the frequency, intensity, and duration of these adverse environmental conditions. The development of stress-tolerant cultivars with higher yields is at the top of the priority list for meeting future food and nutrition needs. Comprehensive knowledge about the molecular mechanism of stress tolerance would be the initial step towards the development of stress tolerant crops.

## Plant Environment Stress Database

There are few available databases that contain meagre information on stress responsive genes namely- Plant Stress Gene Database, STIFDB, Arabidopsis stress responsive gene database etc. As they lack complete genome-wide information about the genes such as- information about regulatory elements, sequence (gene/CDS/Protein) information, genomic variants (SNPs) and structural information. There are studies reported that explored transcriptional or post-transcriptional regulatory interactions (Palaniswamy et al. 2006; Chien et al. 2015; Wilkins et al. 2016); still the integrated perspective of regulatory network is lacking. The present effort involved construction of highly curated authentic database named Plant environmental stress gene Database (PlantESdb), which contains comprehensive, high quality resources for the individual as well as combined environmental stresses responsive genes (ESR genes) and their transcriptional and post-transcriptional regulatory networks in Arabidopsis and maize from published literature and various genomic databases with an effective knowledge based information retrieval system.

## Highlights

**Update 1:** Description of the first highlight.

### Abstract

Drought stress has a negative impact on crop yield. Thus, understanding the molecular mechanisms responsible for plant drought stress tolerance is essential for improving this beneficial trait in crops. In

## Gene: AT1G01310

### Description

CAP (Cysteine-rich secretory proteins, Antigen 5, and Pathosis-related 1 protein) superfamily protein [Source:NCBI gene (formerly Entrezgene);Acc:839333]

### Gene Synonyms

F6F3.11, F6F3\_11

### Location

Chromosome 1: 120,154-121,130 forward strand.

### About this gene

This gene has 1 transcript ([splice variant](#)), 138 orthologues and 19 paralogues.

### Plant and Environment Stress

Land plants are frequently exposed to a variety of undesirable, or even adverse, environmental conditions due to their sessile nature. Abiotic (salinity, drought, heat, cold, heavy metals, ozone, UV radiation, and nutritional deficits) and biotic (microbes, insects, and herbivores) stressors are key restrictions that affect plant development, growth, and reproduction and pose a major threat to the lives of plants. The catastrophic forecast of global warming, which is expected to have a negative impact on crop yield and thus on food production, is expected to increase the frequency, intensity, and duration of these adverse environmental conditions. The development of stress-tolerant cultivars with higher yields is at the top of the priority list for meeting future food and nutrition needs. Comprehensive knowledge about the molecular mechanism of stress tolerance would be the initial step towards the development of stress tolerant crops.

Cytoscape.js Database

## Search Gene Data

Enter Gene IDs to search for related miRNA data.

Select Table:

Arabidopsis

Arabidopsis

Maize

V4

Enter Gene IDs (comma or space separated):

e.g. gene1, gene2

Search

After selecting  
the table we  
just have to  
enter ids then  
search.

Download as .txt

Graph Layout:

Force-Directed

Generate Regulatory Network

Calculate Degree Centrality

Export Graph as JSON

Node Connection Table

Copy CSV Excel

Degree Centrality Values

Search:

Then click on  
generate  
Regulatory  
Network

Enter Gene IDs to search for related miRNA data.

Select Table:

Arabidopsis

Select Version:

V4

Enter Gene IDs (comma or space separated):

AT1G69170 ,AT3G02155,AT4G00150

Search

Select Node Color: Yellow

Select Graph Layout: Force-Directed

Generate Regulatory Network

Calculate Degree Centrality

Export Graph as JSON

Download Graph as Image

### Node Connection Table

### Degree Centrality Values

### Database Table

Copy CSV Excel

Search:

GENE ID

MIRNA ID

RELATION

AT1G69170

ath-miR156i

miRNA-DEG

AT1G69170

ath-miR156j

miRNA-DEG

AT1G69170

ath-miR156a

miRNA-DEG

AT1G69170

ath-miR156b

miRNA-DEG

AT1G69170

ath-miR156c

miRNA-DEG

We can calculate  
Degree Centrality  
by click here.

## Search Gene Data

Enter Gene IDs to search for related miRNA data.

Select Table:

Arabidopsis

Select Version:

V4

Enter Gene IDs (comma or space separated):

AT1G69170 ,AT3G02155,AT4G00150

Search

Download as .txt

Select Node Color:

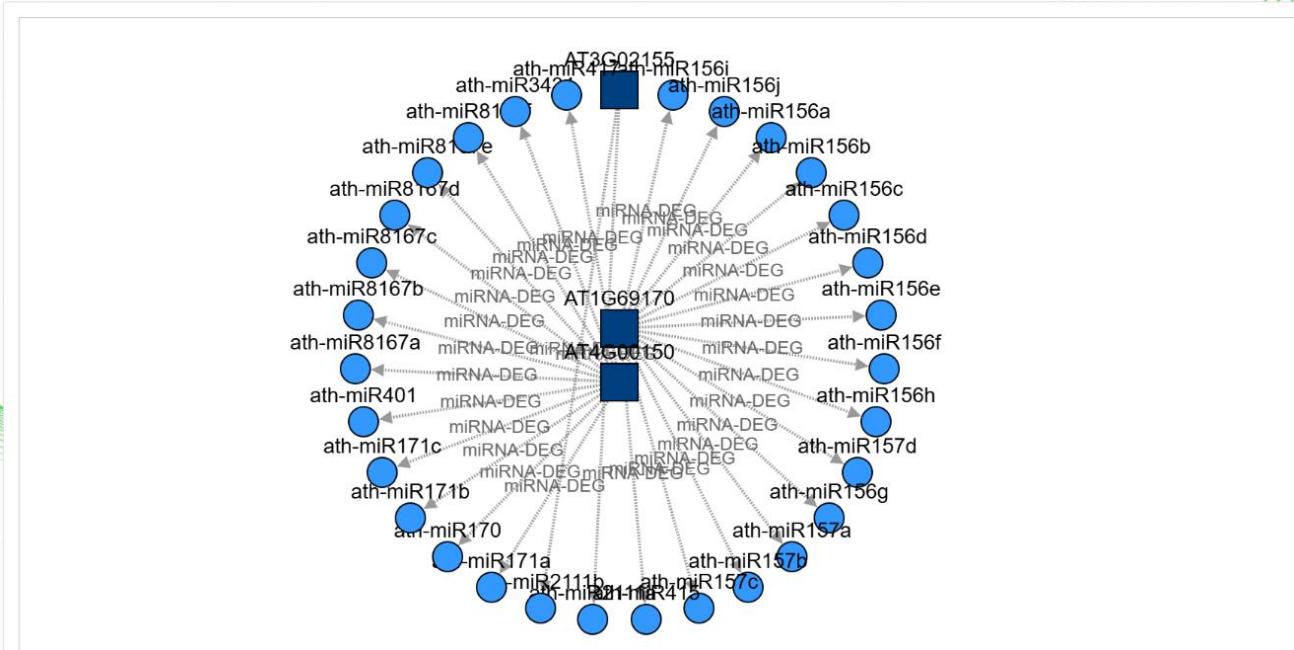

Select Graph Layout: Concentric

Generate Regulatory Network

Calculate Degree Centrality

Export Graph as JSON

Download Graph as Image
